

Arduino GROUP 30

Read me

1. Connect the controller to a voltage of five volts, or to the USB input in your computer.
2. Place the servo in front of your chair where you will be sure the wind will hit you
3. Once the servo has been placed, please choose the right speed state and the system will act accordingly.
4. If you want to call the waiter, just press the button and the LED will turn on.
5. Make sure to remember to turn it off using the same button after the service.

Expected System Actions: When the servo has been placed the user needs to press the button on the remote, the servo motor changes speed.
